

ABOUT ANANT THAKUR

Anant Thakur is a 35-year-old self-taught developer from Lakhnadon, a town in Madhya Pradesh, India. He began his coding journey later than most, but with a clear and determined goal: to build a stable career as a freelance developer and achieve financial independence without depending on a traditional office job.

LEARNING JOURNEY

Anant started with the absolute fundamentals of Python, including variables, data types, loops, and functions. He then advanced through file handling, JSON, error handling, and object-oriented programming, mastering all four pillars: encapsulation, abstraction, inheritance, and polymorphism. His first major project was a shop inventory management system, which he later refactored into a clean class-based structure.

PROJECTS BUILT

Over several months, Anant built a series of real projects. He created a live weather tool that fetches current temperature and humidity for any city using public APIs. He built an AI chatbot with conversation memory and a custom personality. Most recently, he constructed a multi-step gold price agent that searches the web for the current gold price and exchange rate, then calculates the price of gold per ten grams in Indian rupees.

TOOLS AND TECHNOLOGIES

Anant works primarily with Python. He uses Git and GitHub for version control, hosting all his projects publicly under the username AnantThakur06. For AI work, he uses the Groq API to access large language models and the Tavily API for live web search. He stores his secret API keys safely in environment files protected by gitignore.

GOALS AND PHILOSOPHY

Anant believes in learning by doing rather than passively watching tutorials. He prefers writing ten minutes of real code over watching a twenty-minute video. His ultimate goal is to build AI automation tools for small businesses as a freelancer, starting on platforms like Upwork. He is currently learning to build a document question-answering system using retrieval-augmented generation.

FAVORITE THINGS

Anant's favorite programming language is Python. His hometown is Lakhnadon. His preferred way of learning is hands-on building with a strict mentor who does not let him skip steps or take shortcuts.
